

## Managed Security Prevention Service

In the event a network is infected with malware, such as command & control, crypto lockers and other more advanced security threats, “Time To Detect” is critical at both a network and system level.

Threats are on the rise day by day. They are getting more effective and are becoming more dangerous to your business. The hackers are getting smarter about how they target your data and information through means of not just your network but over the many cloud based applications and mobile users that businesses have these days. It is imperative that you manage your security controls tightly across all these vectors to minimise the opportunities they have to get access to your valuable information.

Malware is one of the most serious of breaches as it

accounts for some of the most sophisticated attacks in recent times. Data is the key to most of these attacks from locking down your devices, to infecting your servers and network equipment right through to holding your business to ransom. Malware can be very difficult to identify and to get rid of if you don't know what to look for as it takes many forms in the early stages to find its home.

Brace168's B Secure is all about preventative controls focusing on inside out security. Making sure that your posture is good to start and controlling the flow of threats within and into your network. It's about making sure that you have the controls in place to understand when things are not right and how to remediate them so that you remain safe from Malware.

### Why you need to be secure

Malware infections and service vulnerabilities are reported to Australian Internet Security Initiative (AISI) members every day. On June 24, 2018, 6370 cases of malware infections were reported. Establish a system to detect and prevent malicious attacks and data breaches within your environment, to give you a healthy security posture. Attacks and breaches could cost you more money down the track than being proactive about security.

## Preventative Security Control

The Brace168 B Secure service includes:

- Managed Anti-Malware and Endpoint Protection**
- Managed Firewall**
- DNS Monitoring and Filtering**
- Managed Intrusion Prevention System**

### How we can help

We at Brace168 have the expertise in detective and preventative controls against malware infections. With 168 (24x7) oversight on your digital environment, you can be secure in your defence armoury.
